The faster your flash drive, the more smoothly programs will run. When shopping for a drive, look at the specs and try to find one with a read rate of 15 Mbps (megabits per second or 1.9 MB/sec) or faster. If you already have a flash drive, you can test its speed with a free utility like HDTach. Note: This link takes you to the vendor’s site, where you can download the latest version of the software. –Scott Dunn Rumours that all 360 avatars come with specs and pimples have yet to be confirmed Engadget HD is reporting that the upcoming revamp of the Xbox 360’s interface - dubbed New Xbox Experience - will offer, for the first time anywhere, streaming High Definition movies.Although you can already download HD movies to the 360 using Microsoft’s own Live Marketplace, the Netflix service will be the first to offer movies streamed live in High Def.There will only be a small HD selection (around 300 titles) available on its launch date of 19 November, with pricing and resolution still to be confirmed.Netflix to hand HD to Microsoft firstThe launch of HD streaming on the 360 is quite a coup, as even subscribers to Netflix’s own Watch Instantly portal won’t be able to access the service initially.Naturally, the streaming of HD movies will be dependent on having a decent, uncontented broadband connection, such as can be found in many cabled homes in the US.The Experience will also bring avatars to the 360, as Microsoft targets casual gamers and kids alongside its traditional audience of bedroom gamers.Users will be able to set up simple avatars on the console, with an avatar store selling fancier clothes and features to follow. Don’t count on being able to purchase Second Life-style genitals, mind. At a GlanceSupports advanced features such as keyframingCan handle unlimited tracksNo Flash supportGPU acceleration is nearly nonexistentCluttered designTo be a true bargain, this inexpensive yet powerful video editor needs more refinement and less clutter. So far, no broadcast television networks have committed to broadcasting in 3D, despite the proliferation of 3D HDTVs. No problem- you can’t watch 3D TV, go out and make some content of your own with a 3D camcorder and a video-editing application such as Sony’s Vegas Movie Studio HD Platinum 11 (\$100 as of August 27, 2011). The new version of the software adds stereoscopic-3D-video-editing capabilities to a powerful, albeit somewhat complicated, application. I See in 3D Sony introduced 3D editing in Vegas Pro 10, the pricier sibling of the latest version, last year. With Vegas Movie Studio HD Platinum 11, you now get additional 3D modes. You can edit native 3D content from a 3D camcorder such as the Sony HDR-TD10, for example, or you can create 3D video from 2D content (somewhat effectively); Sony includes a pair of paper anaglyph 3D glasses in the software box. For 2D footage, I found that the conversion was most effective for simple effects like adding 3D titles. You can also export to YouTube’s 3D format. When you use the app’s new Make Movie feature, the software automatically recognizes that you have 3D content to upload to YouTube and you need only enter your YouTube user name, password, and the usual title, description, and tags for it to upload directly to your account. Finally, you can export 3D movies to Blu-ray using the included DVD Architect Studio application. The system requirements for 3D editing are the same as the ones for HD editing- Sony recommends a multicore CPU or multiprocessor system. Even so, since the application recognizes the .mvc 3D video format and the .mpo 3D still-image format natively, it doesn’t have to expend any processing effort on converting such files before you begin editing them. I saw no performance slowdowns at all with my dual-core system, except that the system while I was editing a multi-HD-track project. Speaking of which, Movie Studio HD Platinum 11 lets you edit in a few more HD video formats than its predecessor did, including 720-50p, 720-60p, and 1080-24p; but annoyingly, it won’t import or export Flash files, so if you want to put your videos online, you’ll have to upload them to YouTube or another video site that will convert them for you. Like Sony’s Vegas Pro 10, Movie Studio HD Platinum 11 offers GPU acceleration for encoding to Sony’s .avc format; Sony says that “traditional projects suggest up to 20 percent improvement” in rendering speed. Sony also says that it works not only with “select” Nvidia-based graphics cards, but also with select ATI cards. I saw an average boost of about 18 percent, which is certainly welcome, but it pales in comparison to the orders-of-magnitude boost provided by Adobe Premiere Pro CS5.5. Furthermore, Movie Studio HD Platinum 11 accelerates only a single function- compared to Premiere Pro’s nearly application-wide acceleration. For Sony to boast about its GPU acceleration is like Chevrolet crowing about a new model having eight-spoke wheels instead of seven-spoke ones. What’s Your Title? A new Titles and Text dialog makes adding animated titles fairly easy. For example, you add your text in a dialog box (not directly on your video canvas, unfortunately) where you specify your preferred font and size, and select from several different style settings, including outlines, shadows, line spacing, and tracking. You can also specify the text’s location on the canvas, as you watch a live preview of it- but you can do the same thing by dragging it around the Preview window. You can adjust the size of the text either by increasing the font size in the dialog box or by dragging on handles at the corners of the text box. But if you do the latter, instead of causing the font size measurements to increase, it enlarges a “scale” setting. I found that significantly increasing the size sometimes resulted in fuzzy text. Vegas Movie Studio HD Platinum 11 is a complex application, even for a consumer-grade video editor, with many powerful tools that will please more-advanced users and intimidate newbies. That in itself isn’t a criticism- I usually recommend that people suck it up and learn how to use more-capable products rather than choosing dumbed-down alternatives- but Sony doesn’t do nearly as much as Adobe does to make its consumer-grade video editor accessible to people who aren’t familiar with it. True, Movie Studio HD Platinum offers helpful Show Me How tutorials that lead the way by opening up the proper dialog boxes and highlighting commands- but the topics covered are the most basic ones, not the ones that will vex people who’ve moved beyond the basics. Also, some included features- such as the new ability to add audio effects at the bus level (meaning, delivering the effect to external hardware)- seem unnecessary in a consumer-grade product. If you’re connecting external audio hardware to your video-editing system, you probably aren’t using a \$100 application to edit video. At the same time, Sony devotes a special command in the Tools menu to outputting video for playback on a Sony PlayStation Portable, instead of sticking that function in the Make Movie settings. In the scheme of things, neither the external audio option nor PSP output feel necessary here. On the other hand, Sony deserves some credit for allowing users to add unlimited tracks and for providing keyframe capabilities so you can set the strength of an effect or precisely adjust a clip’s position on the canvas. You must click an Animate button at the bottom of an effect’s dialog box to enable these features, but that’s okay. One annoyance: If you add multiple effects, and you want to reuse keyframes, you have to click the first effect, tab to a keyframe, and then click back to the second effect before you can adjust the latter’s settings. Pro Features. Inexpensive Price Despite lacking a clear design direction, Vegas Movie Studio HD Platinum 11 is a very capable product at a very reasonable price, especially if you want to create 3D movies. It would be even better if Sony stripped out some of the features that are unnecessary in a consumer-grade product, and added better instruction. In a 2010 survey, the Federal Communications Commission (FCC) found that 80 percent of people with broadband Internet in the U.S. didn’t know the speed of that broadband connection [source: Gurin]. In addition, some may be surprised to learn that they’re only getting a fraction of their service’s advertised maximum speeds. For example, your Internet service provider (ISP) might have you on a plan that says “up to 30 Mbps down” while you’re really only getting download speeds of around 19 Mbps. Web sites like speedtest.net offer free tests for both the upload and download speeds of your Internet connection, but be cautious of some of the tempting “start” buttons in ads on the sites -- many are actually well-designed ads that look like they’re part of the site’s test mechanisms. Before you call your ISP about any discrepancies, remember that the plan you’re on is based on a maximum value. Your actual results are affected by factors like your ISP’s peak Web use times, the number of people sharing your line and your distance from the ISP’s fiber pipeline. When it comes to streaming HD video, you’ll need a broadband speed, or bitrate, that’s capable of handling a progressive scan rate of 720p. Since your HD-capable screen is refreshing the screen 60 times per second, this means ensuring that all those video frames are received and ready to play before they’re needed. Your computer or other device will cache all the incoming data and queue the video frames so they’re ready for smooth playback. From there, determining the speed you’ll need seems to be a matter of math. That math, though, requires some idea about the size of the video file. This depends on how the file is encoded, more commonly referred to as the file type. A one-hour 720p video in the MPEG-2 standard might be 2.7 GB while the same video in one of the newest video standards, H.264/Advanced Video Coding (AVC), could be almost 13 GB [source: Digital Rebellion]. Thus, differences in file size could be one explanation for why different Web sites have different speed recommendations for streaming their HD content. Suppose the video you’re streaming is one hour long, and the file size for that video is 6 GB. While a broadband connection of up to 10 Mbps lets you easily stream a lot of video content online, you’ll want 15 Mbps or more for this six-gigabyte HD video. Here’s a quick look at the math: Approximate megabytes: 6 GB = 6,144 MB (1 GB = 1024 MB) Approximate megabits: 6,144 MB = 49,152 Mb (1 byte = 8 bits) Number of seconds per hour calculation: 60 x 60 = 3,600 Megabits per hour calculation: 49,152 / 3,600 = 13.65 Mbps When you’re streaming HD content, also consider whether the connection jumps over a wireless router. If so, note that the connection speed could drop over the connection if the WiFi standard isn’t fast enough. You’ll want to avoid slower 802.11b connections, and the newest 802.11n is the ideal choice to keep up with faster broadband services. As with anything you do over your broadband connection, be sure to note whether your ISP will slow down or stop your service after reaching a certain bandwidth threshold. Some sites, such as Netflix, let you choose a lower playback quality to help you stay within those thresholds, even though it means giving up the higher definition. Also, make sure the hardware you’re using isn’t just HD-capable, but it has the processing power to cache and play video files in HD. For lots more information about your internet connection and streaming HD video, head on over to the next page.
